

Assembly Instructions:

Learn how to find stars with this simple device. Paste both sheets onto separate pieces of cardboard. Then cut around the outside circle on each sheet. Cut out the viewing window (shaded), and assemble with a split pin. Cut out viewing instructions (below) and paste onto back.

Viewing Instructions:

Align your time of night with the month of the year, and hold the planisphere so that the correct horizon (north, south, east or west) is at the bottom according to which way you are facing. The split pin is located at the south celestial pole, and the visible stars in the whole sky are found inside the viewing window, with stars overhead at the centre of the viewing window.
